技术规格

Background:	The protein encoded by this gene belongs to the type I cytokine receptor family. This receptor, with homology to gp130, is expres sed on monocytes, and is involved in IL-31 signaling via activatio n of STAT-3 and STAT-5. It functions either as a monomer, or as part of a receptor complex with oncostatin M receptor (OSMR). Several alternatively spliced transcript variants encoding different isoforms have been noted for this gene.
